

L23 - VLAN and High Speed Ethernet

VLANs and High Speed Ethernet

The Ethernet Evolution

Agenda

- Ethernet Evolution
- VLAN
- High Speed Ethernet
 - Introduction
 - Fast Ethernet
 - Gigabit Ethernet
 - 10 Gigabit Ethernet

L23 - VLAN and High Speed Ethernet

The Beginning

- **initial idea: shared media LAN**

- bus structure, CSMA/CD was access method
- coax cable, transmission rate up to 10 Mbit/s
- half-duplex transmission (two physical wires e.g. coax)

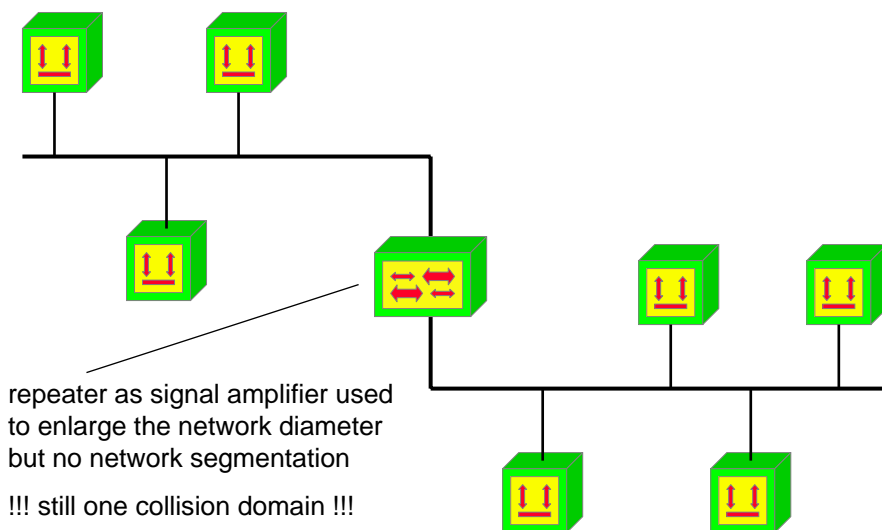

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

4

L23 - VLAN and High Speed Ethernet

Multiport Repeater

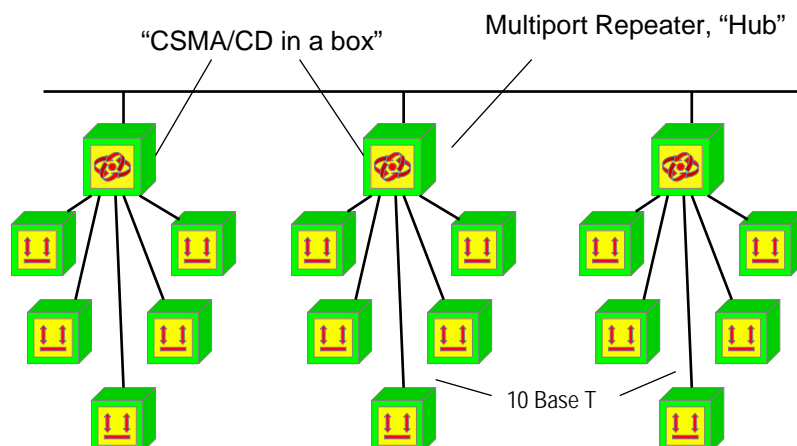

- **demand for telephony-like point-to-point cabling using Twisted Pair wires**
 - based on structured cabling standard
 - 10BaseT as new Ethernet type to support this demand
 - four physical wires (2 for tmt, 2 for rcv)
- **network stations are connected star-like to a multiport repeater**
 - multiport repeater is called “hub”
- **hub simulates the bus: "CSMA/CD in a box"**
- **only half-duplex**
 - only one network station can use the network at a given time, all others have to wait

VLAN and High Speed Ethernet, v4.6

6

L23 - VLAN and High Speed Ethernet

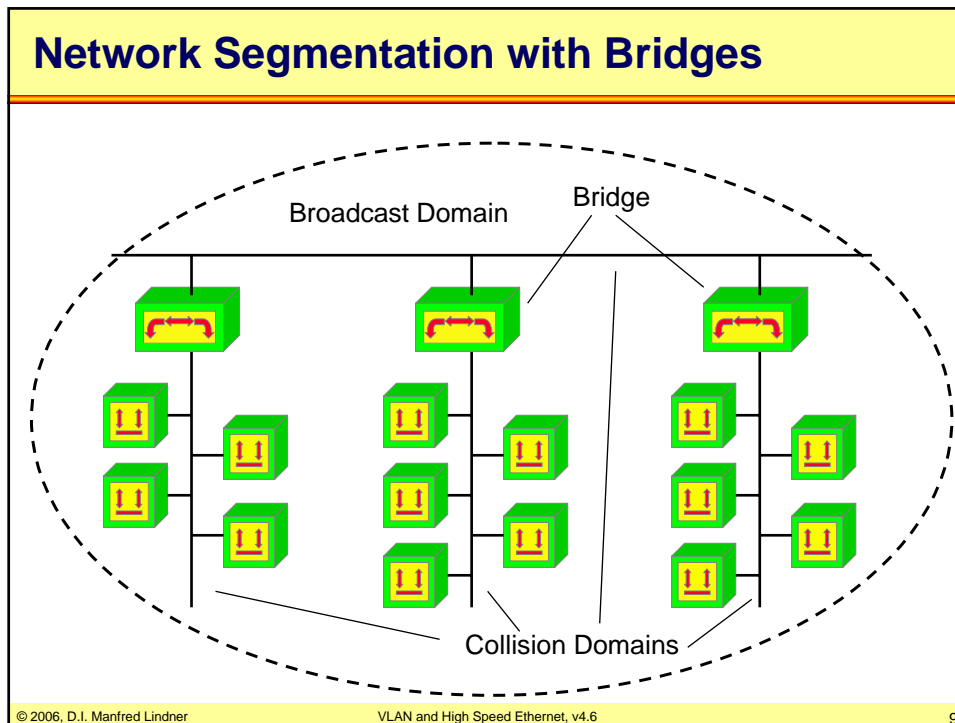

Structured Cabling (2)

Bridging

- **simple physical amplification with repeaters became insufficient**
 - with repeaters all nodes share the given bandwidth
 - the whole network is still one collision domain
 - -> technology moved toward layer 2
- **bridges segment a network into smaller collision domains**
 - store and forward technology (packet switching)
 - the whole network is still a broadcast domain
 - Spanning Tree provides a unique path between each two devices and avoids broadcast storms

L23 - VLAN and High Speed Ethernet

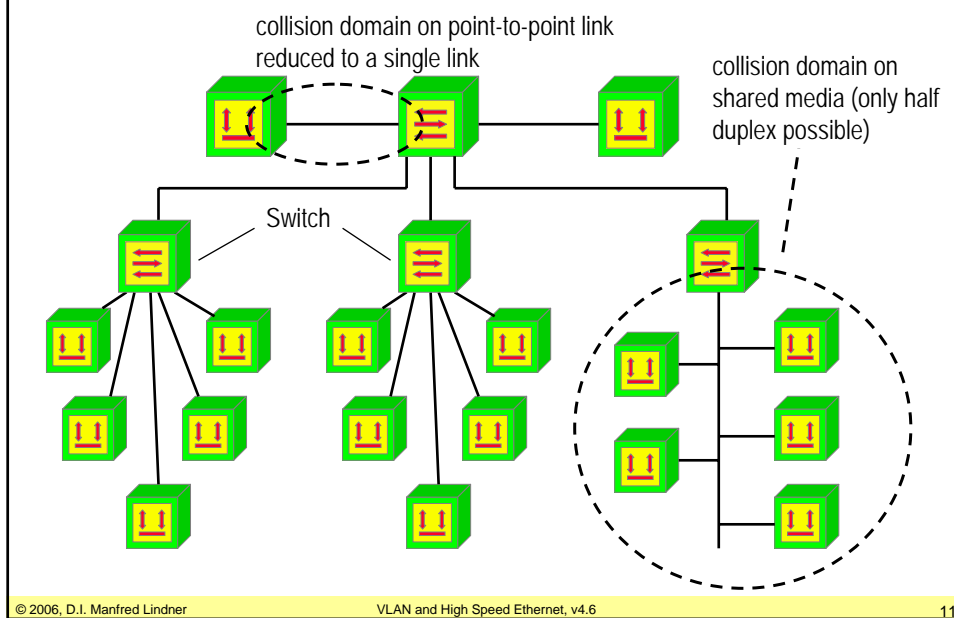

Switching (1)

- **"switching" means fast transparent bridging**
 - implemented in hardware
 - also called Layer 2 (L2) switching or Ethernet switching
- **multiport switches allow full duplex operation on point-to-point links**
 - no need for collision detection (media access control) on a link which is shared by two devices only
 - network station <-> switch port
 - switch <-> switch
- **multiport switches replaces multiport repeaters**
 - a collision free Ethernet can be built, if network consists of point-to-point links only

L23 - VLAN and High Speed Ethernet

Switching (2)

Switching (3)

L23 - VLAN and High Speed Ethernet

Switching (4)

full duplex everywhere = collision free Ethernet LAN

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

13

Switching (5)

- **L2 switches can connect Ethernets with 10 Mbit/s, 100 Mbit/s or 1000 Mbit/s for example**
 - clients using 10 Mbit/s either half duplex on shared media or full duplex on point-to-point connection with switch
 - server uses 100 Mbit/s, full duplex, point-to-point connection with switch
 - note: multiport repeater is not able to do this !
- **L2 switch as packet switch operates with asynchronous TDM**
 - congestion can be avoided by using a new MAC based flow control (pause command)

VLAN and High Speed Ethernet, v4.6

19

Virtual LANs (1)

- **today's work-groups are expanding over the whole campus in case of local environment**
- **users of one workgroup should be kept separated from other workgroups**
 - because of security reasons they should see there necessary working environment only
- **end-systems of one workgroup should see broadcasts only from stations of same workgroup**
- **the network must be flexible**
 - to adapt continuous location changes of the end-systems/users

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

20

L23 - VLAN and High Speed Ethernet

Virtual LANs (2)

- **base idea of VLAN:**
 - multiplexing of several LANs via same infrastructure (switches and connection between switches)
- **today's switches got the ability to combine several network-stations to so-called "Virtual LANs"**
 - separate bridging/switching table maintained for every single VLAN
 - separate broadcast handling for every single VLAN
 - each Virtual LAN is its own broadcast domain
 - separate Spanning Tree for every single VLAN
 - note: IEEE 802.1w specifies a method to share one Rapid Spanning Tree among all VLANs

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

21

VLAN Example

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

22

L23 - VLAN and High Speed Ethernet

VLAN Assignment

- **a station may be assigned to a VLAN**
 - port-based
 - fixed assignment port 4 -> VLAN x
 - most common approach
 - a station is member of one specific VLAN only
 - MAC-based
 - MAC A -> VLAN x
 - allows integration of older shared-media components and automatic location change support
 - a station is member of one specific VLAN only
 - protocol-based
 - IP-traffic, port 1 -> VLAN x
 - NetBEUI-traffic, port 1 -> VLAN y
 - a station could be member of different VLANs

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

23

Virtual Trunks - VLAN tagging

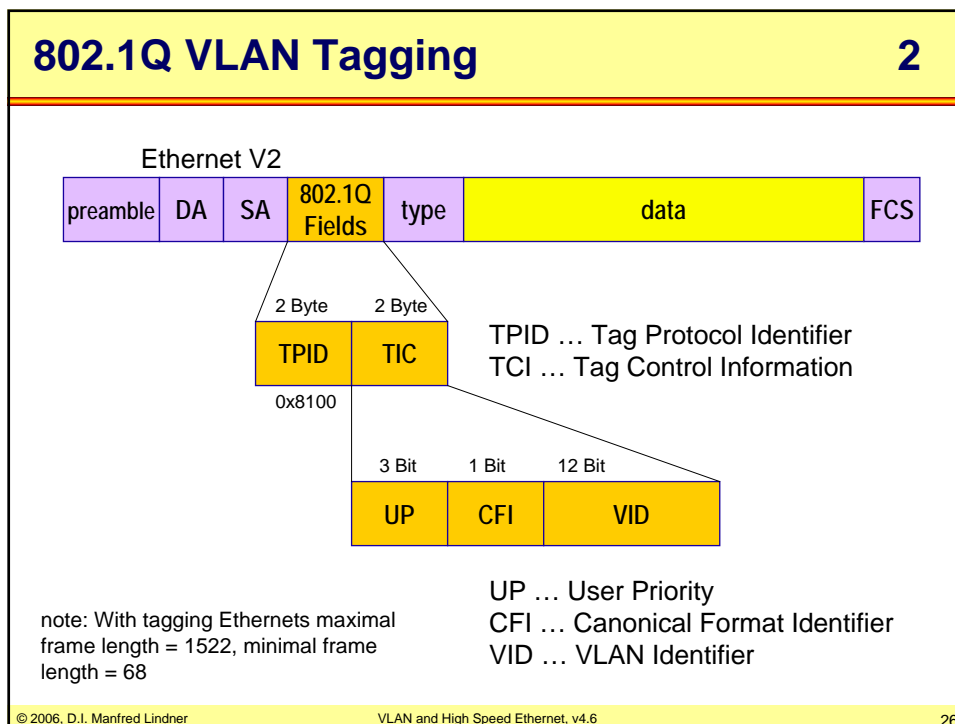

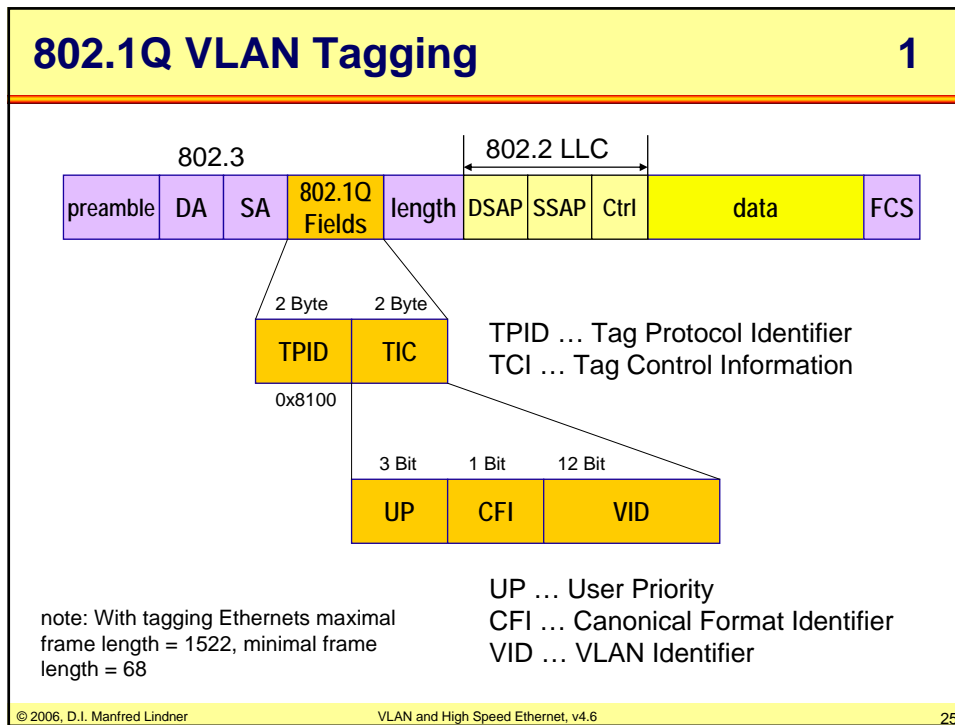

- **switches must be connected via VLAN-trunks on which each particular VLAN-frame is "tagged" (marked) with an identifier**
 - examples for tagging standards:
 - IEEE 802.10 (pre 802.1Q temporary solution)
 - ISL (Cisco)
 - IEEE 802.1Q
- **so switches can distinguish between several VLANs and manage their respective traffic**

© 2006, D.I. Manfred Lindner

VLAN Operation (3)

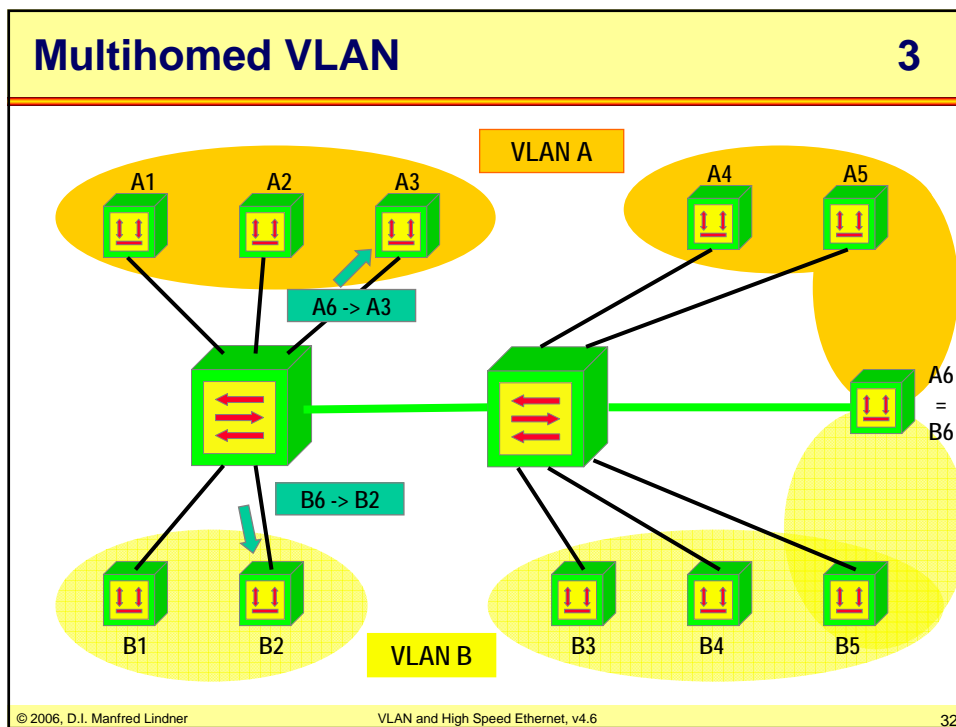

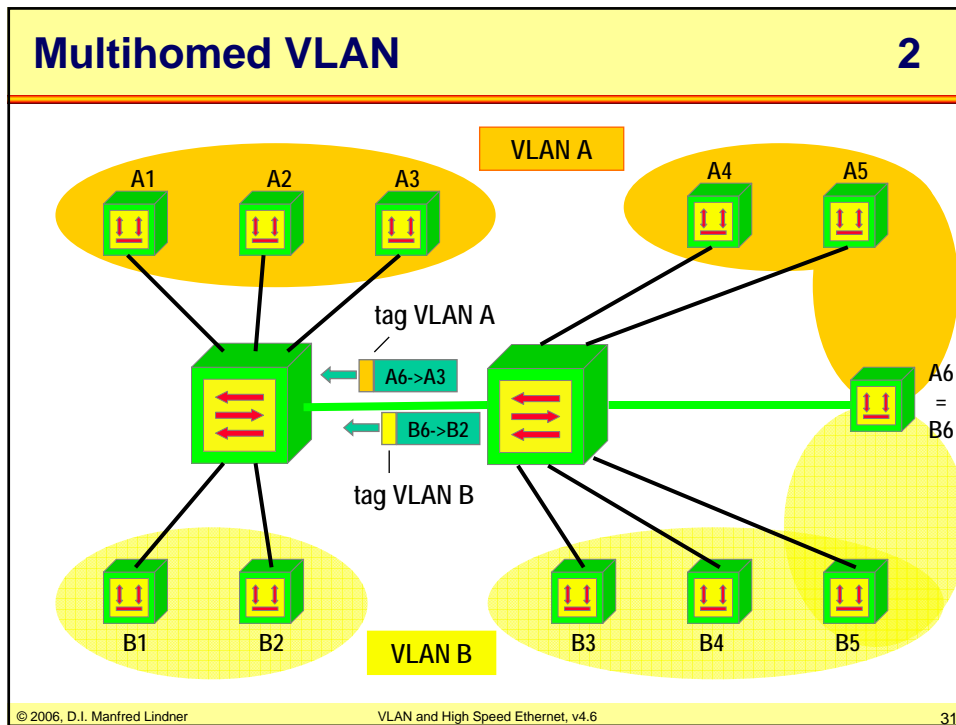

Multihomed VLAN

1

L23 - VLAN and High Speed Ethernet

L23 - VLAN and High Speed Ethernet

Trunking between L2 Switches

- on trunks between multiport switches full duplex operation is possible
 - hence "200 Mbit/s" with Fast Ethernet
 - hence "2 Gbit/s" with Gigabit Ethernet
- on trunks bundling (aggregation) of physical links to one logical link is possible
 - Fast Ethernet Channeling (Cisco)
 - 400 / 800 Mbit/s
 - Gigabit Ethernet Channeling (Cisco)
 - 4 / 8 Gbit/s
 - IEEE 802.3 (2002) LACP (Link Aggregation Control Protocol)

L23 - VLAN and High Speed Ethernet

Agenda

- **Ethernet Evolution**
- **VLAN**
- **High Speed Ethernet**
 - Introduction
 - Fast Ethernet
 - Gigabit Ethernet
 - 10 Gigabit Ethernet

IEEE 802.3 (2002)

- **the latest version of IEEE 802.3 specifies**
 - operation for 10 Mbit/s, 100 Mbit/s and Gigabit/s Ethernet
 - full duplex Ethernet
 - auto-negotiation
 - flow control
- **it is still backward compatible to the old times of Ethernet**
 - CSMA/CD (half-duplex) operation in 100 and 1000 Mbit/s Ethernet with multiport repeater possible
 - frame bursting or carrier extension for ensuring slot-time demands in 1000 Mbit/s Ethernet
- **IEEE 802.3ae specifies (2004)**
 - operation for 10 Gigabit/s Ethernet over fiber
- **IEEE 802.3ak on the way (2006)**
 - operation for 10 Gigabit/s Ethernet over copper

L23 - VLAN and High Speed Ethernet

Full-Duplex Mode

- **full-duplex mode is possible on point-to-point links**
 - except 100BaseT4 (Cat 3 cable), 100BaseVG which can work in half duplex mode only
 - note: 10Base2 and 10Base5 are shared links and by default half duplex medias
- **if a network station is connected to an Ethernet switch via point-to-point link**
 - CSMA/CD is not necessary and can be switched off
- **now a network station can**
 - send frames immediately (without CS) using the transmission-line of the cable and simultaneously receive data on the other line

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

49

Flow Control

- **speed-requirements for switches are very high**
 - especially in full duplex operation
 - also powerful switches can't avoid buffer overflow
 - earlier, high traffic caused collisions and CSMA/CD interrupted the transmission in these situations, now high traffic is normal
- **L4 flow control (e.g. TCP) between end-systems is not efficient enough for a LAN**
 - switches should be involved to avoid buffer overflow
- **therefore a MAC based (L2) flow control is specified**
 - MAC-control-protocol and the Pause command

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

50

L23 - VLAN and High Speed Ethernet

MAC-Control Frame

- identified among other frames by setting length field = 8808 hex

MAC-ctrl opcode defines function of control frame

MAC-ctrl parameters control parameter data; always filled up to 44 bytes, by using zero bytes if necessary

- currently only the "pause" function is available (opcode 0x0001)

The Pause Command

1

- on receiving the pause command
 - station stops sending normal frames for a given time which is specified in the MAC-control parameter field
- this pause time is a multiple of the slot time
 - 4096 bit-times when using Gigabit Ethernet or 512 bit-times with conventional 802.3
- paused station waits
 - until pause time expires or an additional MAC-control frame arrives with pause time = 0
 - note: paused stations are still allowed to send MAC-control-frames (to avoid blocking of LAN)

L23 - VLAN and High Speed Ethernet

The Pause Command

2

- **destination address is either**
 - address of destination station or
 - broadcast address or
 - special multicast address 01-80-C2-00-00-01
- **this special multicast address prevents bridges to transfer associated pause-frames to not concerned network segments**
- **hence flow-control (with pause commands) affects only the own segment**

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

53

Demand for Higher Speed

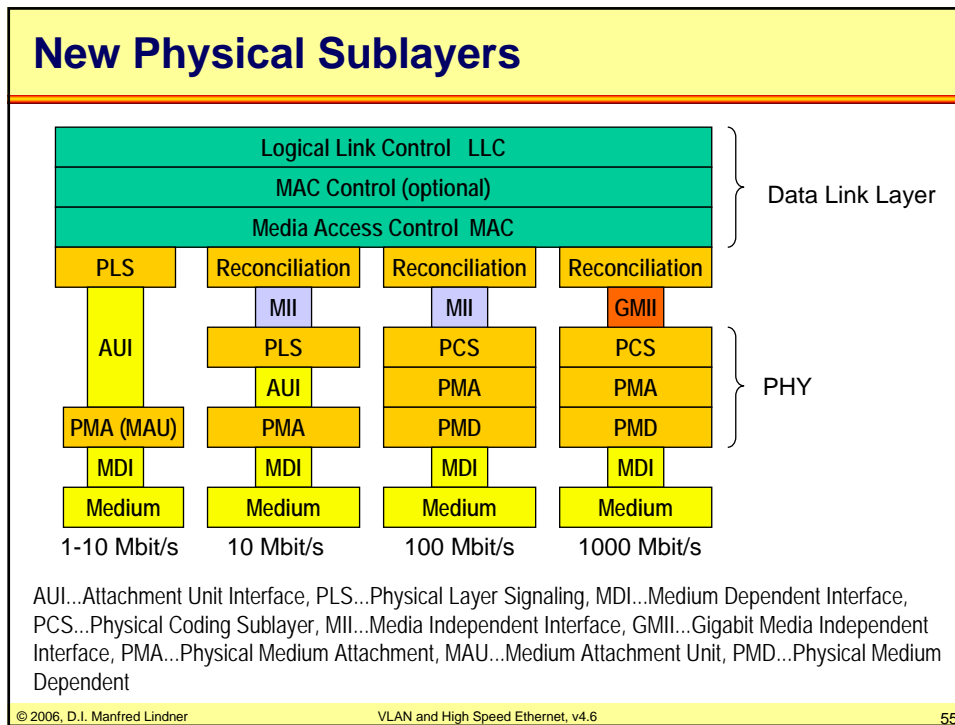

- **higher data rates need more sophisticated coding**
 - 10 Mbit/s Ethernet: Manchester coding
 - Fast Ethernet (100 Mbit/s): 4B/5B block code
 - Gigabit Ethernet 1000 Mbit/s): 8B/10B block code
- **new implementations should be backwards-compatible**
 - old physical layer signaling interface (PLS), represented by AUI, was not suitable for new coding technologies
- **AUI has been replaced**
 - MII (Media Independent Interface) for Fast Ethernet
 - GMII for Gigabit Ethernet

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

54

L23 - VLAN and High Speed Ethernet

PHY Sublayers

- **Physical Layer Signaling (PLS) serves as abstraction layer between MAC and PHY**
- **PLS provides**
 - data encoding/decoding (Manchester)
 - translation between MAC and PHY
 - Attachment Unit Interface (AUI) to connect with PMA
- **several new coding techniques demands for a Media Independent Interface (MII)**
- **today coding is done through an media-dependent Physical Coding Sublayer (PCS) below the MII**

© 2006, D.I. Manfred Lindner VLAN and High Speed Ethernet, v4.6 56

L23 - VLAN and High Speed Ethernet

PHY Sublayers

- **PLS has been replaced with the Reconciliation sublayer**
 - Reconciliation layer transforms old MAC PLS-primitives into MII control signals
- **MIl serves as an interface between MAC and PHY**
 - hides coding issues from the MAC layer
 - MII: often a mechanical connector for a wire; GMII is an interface specification between MAC-chip and PHY-chip upon a circuit board
 - one independent specification for all physical media
 - supports several data rates (10/100/1000 Mbits/s)
 - 4 bit (GMII: 8 bit) parallel transmission channels to the physical layer

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

57

PHY Sublayers

- **Physical Coding Sublayer (PCS)**
 - encapsulates MAC-frame between special PCS delimiters
 - 4B/5B or 8B/10B encoding respectively
 - appends idle symbols
- **Physical Medium Attachment (PMA)**
 - interface between PCS and PMD
 - (de) serializes data for PMD (PCS)
- **Physical Medium Dependent (PMD)**
 - serial transmission of the code groups
 - specification of the various connectors (MDI)

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

58

L23 - VLAN and High Speed Ethernet

Bridging Aspects

- **new PHY-sublayers preserves old Ethernet MAC frame format**
 - bridging from 10 Mbit/s Ethernet to 100 Mbit/s Ethernet does not require a bridge to change the frame format
 - Remark: bridging from 10 Mbit/s Ethernet to FDDI (100 Mbit/s Token ring) requires frame format changing -> slower !!
- **therefore Ethernet L2 switches**
 - can connect Ethernets with 10 Mbit/s, 100 Mbit/s or 1000 Mbit/s easily and fast

Today: Gigabit Ethernet

- **continues point-to-point and full-duplex idea**
- **also backward compatible with initial 10 Mbit/s shared media idea -> CSMA/CD capable**
- **but nobody uses it as shared media!**
 - multiport repeater with Gigabit Ethernet seems absurd because of small network diameter (20m)
 - 200m with carrier extension and burst mode
 - bandwidth sharing decreases performance; every collision domain produces an additional delay for a crossing packet
 - full duplex means exclusive, unshared, high performance point-to-point connections between two stations (total 2Gbit/s!)

L23 - VLAN and High Speed Ethernet

Gigabit Ethernet becomes WAN

- **point-to-point full-duplex connections do not limit the maximal network diameter as CSMA/CD does**
 - Gigabit over fiber optic cables reach 70 km length (and even more)
- **trend moves towards layer 3 switching**
 - high amount of today's traffic goes beyond the border of the LAN
 - routing decisions enable load balancing and decrease network traffic
- **Gigabit Ethernet becomes WAN technology**

62

L23 - VLAN and High Speed Ethernet

100 Mbit/s Ethernet

- **Access method disagreement split 100 Mbit/s LAN development into two branches:**
 - Fast Ethernet - IEEE-802.3u (today 802.3-2002)
 - 100VG-AnyLAN - IEEE-802.12 (disappeared)
- **Fast Ethernet was designed as 100 Mbit/s and backwards-compatible 10Mbit/s Ethernet**
 - CSMA/CD but also
 - Full-duplex connections (collision free)
- **Network diameter based on collision window requirement (512 bit times)**
 - reduced by factor 10
 - e.g. 250m compared with 2500m at 10 Mbit/s

L23 - VLAN and High Speed Ethernet

Autonegotiation

- **Autonegotiation support enables two 100BaseT devices (copper only) to exchange information about their capabilities**
 - signal rate, CSMA/CD or full-duplex
- **Achieved by Link-Integrity-Test-Pulse-Sequence**
 - Normal-Link-Pulse (NLP) technique is already available in 10BaseT to check the link state
 - 10 Mbit/s LAN devices send every 16 ms a 100ns lasting NLP -> no signal on the wire means disconnected
- **100BaseTX uses bursts of Fast-Link-Pulses (FLP) consisting of 17-33 NLPs**
 - Each representing a 16 bit word

© 2006, D.I. Manfred Lindner VLAN and High Speed Ethernet, v4.6 68

L23 - VLAN and High Speed Ethernet

FLP Burst Coding

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

69

Autonegotiation

- To avoid increase of traffic FLP-bursts are only sent on connection-establishments
- 100BaseT stations recognizes 10 Mbit/s stations by receiving a single NLP only
- Two 100BaseT stations analyze their FLP-bursts and investigate their largest common set of features
- Last frames are sent 3 times -> other station responds with acknowledge-bit set
- Negotiated messages are sent 6-8 times
 - FLP- session stops here

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

70

L23 - VLAN and High Speed Ethernet

FLP-Session

- **The first FLP-burst contains the base-link codeword**
- **By setting the NP bit a sender can transmit several "next-pages"**
 - Next-pages contain additional information about the vendor, device-type and other technical data
- **Two kinds of next-pages**
 - Message-pages (predefined codewords)
 - Unformatted-pages (vendor-defined codewords)
- **After reaching the last acknowledgement of this FLP-session, the negotiated link-codeword is sent 6-8 times**

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

71

Base Page

Selector field

Technology ability field

provides selection of up to 32 different message types; currently only 2 selector codes available:
 10000....IEEE 802.3
 01000....IEEE 802.9 (ISLAN-16T) (ISO-Ethernet)

Bit	Technology
A0	10BaseT
A1	10BaseT-full duplex
A2	100BaseTx
A3	100BaseTx-full duplex
A4	100BaseT4
A5	Pause operation for full duplex links
A6	reserved
A7	reserved

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

72

L23 - VLAN and High Speed Ethernet

Base Page

- **Remote Fault (RF)**
 - Signals that the remote station has recognized an error
- **Next Page (NP)**
 - Signals following next-page(s) after the base-page
- **Acknowledge (Ack)**
 - Signals the receiving of the data (not the feasibility)
 - If the base-page has been received 3 times with the NP set to zero, the receiver station responds with the Ack bit set to 1
 - If next-pages are following, the receiver responds with Ack=1 after receiving 3 FLP-bursts

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

73

Next-Pages Codeword

Message code field

Examples:

1000000000null message, station has no further information to send

0100000000next page contains technology ability information

1010000000next 4 pages contain Organizationally Unique Identifier (OUI) information

Unformatted code field

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

74

L23 - VLAN and High Speed Ethernet

Next-Pages

- **Acknowledge 2 (Ack2)**
 - Ack2 is set to 1 if station can perform the declared capabilities
- **Message Page (MP)**
 - Differentiates between message-pages (MP=1) and
 - Unformatted-pages (MP=0)
- **Toggle (T)**
 - Provides synchronization during exchange of next-pages information
 - T-bit is always set to the inverted value of the 11th bit of the last received link-codeword

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

75

Coding

- **4B/5B block encoding: each 4-bit group encoded by a 5 bit run-length limited "code-group"**
 - Code groups lean upon FDDI-4B/5B codes
 - Some additional code groups are used for signaling purposes; remaining code groups are violation symbols
→ easy error detection
 - Groups determinate maximal number of transmitted zeros or ones in a row → easy clock synchronization
 - Keeps DC component below 10%
- **Code groups are transmitted using NRZI-encoding**
 - Code efficiency: $4/5 = 100/125 = 80\%$ (Manchestercode only 50 %)

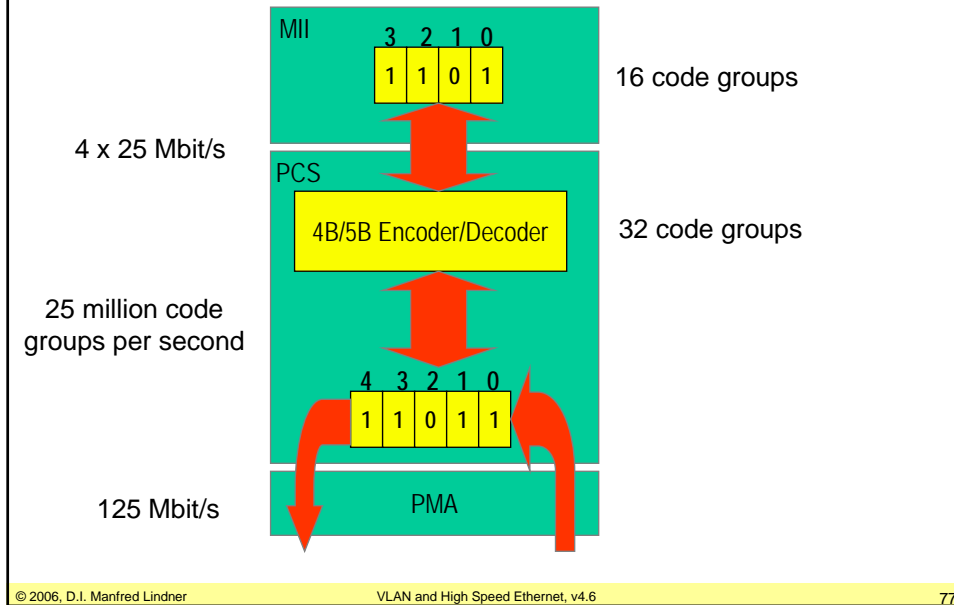

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

76

VLAN and High Speed Ethernet, v4.6

78

L23 - VLAN and High Speed Ethernet

Signaling Types

- **Three signaling types :**

- 100BaseX:
 - refers to either the 100BaseTX or 100BaseFX specification
- 100BaseT4
- 100BaseT2

- **100BaseX**

- combines the CSMA/CD MAC with the FDDI Physical Medium Dependent layer (PMD)
- allows full duplex operation on link

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

79

Signaling Types

- **100BaseT4**

- allows half duplex operation only
- 8B6T code
- Uses 4 pairs of wires; one pair for collision detection, three pair for data transmission
- One unidirectional pair is used for sending only and two bi-directional pairs for both sending and receiving
- Same pinout as 10BaseT specification
- Transmit on pin 1 and 2, receive on 3 and 6; bi-directional on 4 and 5; bi-directional on 7 and 8

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

80

L23 - VLAN and High Speed Ethernet

100BaseTX and 100BaseFX

- **100BaseTX:**

- 125 MBaud symbol rate, full duplex, binary encoding
- 2 pair Cat 5 unshielded twisted pair (UTP) or 2 pair STP or type 1 STP
- RJ45 connector; same pinout as in 10BaseT (transmit on 1 and 2, receive on 3 and 6)

- **100BaseFX:**

- 125 MBaud symbol rate, full duplex, binary encoding
- Two-strand (transmit and receive) 50/125 or 62.5/125-μm multimode fiber-optic cable
- SC connector, straight-tip (ST) connector, or media independent connector (MIC)

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

81

100BaseT4 and 100BaseT2

- **100BaseT4:**

- 25 MBaud, half duplex, ternary encoding
- Cat3 or better, needs all 4 pairs installed
- 200 m maximal network diameter
- maximal 2 hubs

- **100BaseT2:**

- 25 MBaud, full duplex, quinary encoding
- 2 pairs Cat3 or better

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

82

L23 - VLAN and High Speed Ethernet

100VG-AnyLAN

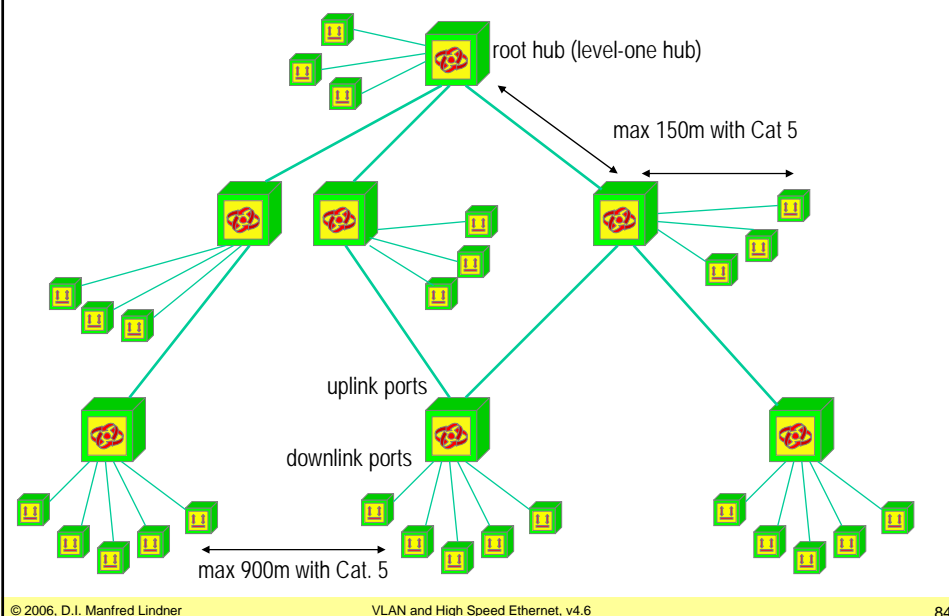

- specified by HP and AT&T, standardized by IEEE 802.12
- uses 802.2 LLC but incompatible with 802.3 MAC
- designed for existing "Voice Grade" cabling (point to point only, unidirectional) in a tree structured net; hubs are arranged hierarchically
- demand priority access method which is more deterministic than CSMA/CD; eliminates collisions and can be more heavily loaded than 100BaseT

VLAN and High Speed Ethernet, v4.6

84

L23 - VLAN and High Speed Ethernet

100VG-AnyLAN Operation

1

- station is in a sending or receiving mode (never both)
- each hub has at least one uplink port and several downlink ports
- hubs can be cascaded 3 levels deep; level 1 hub controls the priority domain and polls its connected hubs
- station signals send-request to the hub
- if network is idle, station gets sending permission immediately; station sends packet to the hub

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

85

100VG-AnyLAN Operation

2

- on receiving more than one request: hub schedules sending permissions using a round robin method which can be controlled by priority tags (packet switching task)
- to ensure fairness, a hub does not grant priority access to a port more than twice in a row
- 5B/6B block code
- various cabling types
 - 4 wire pairs of Cat 3 UTP (100m)
 - 2 wire pairs Cat 4 or Cat 5 UTP (150m)
 - STP cable
 - Fibre Optic

VLAN and High Speed Ethernet, v4.6

87

Gigabit-Ethernet: IEEE-802.3z / IEEE802.3ab

- **Easy integration in existing 802.3 LAN configurations because backwards compatible**
 - Through integration of 3 different transceivers for 10, 100 and 1000 Mbit/s
 - No need to change existing equipment
 - Supports also 10 Mbit/s and 100 Mbit/s (not with fibre)
 - Access methods: CSMA/CD or full duplex
- **Backbone technology; has also WAN capabilities**
 - Reaches 70 km length using fibre optics
 - 1 Gbit/s data rate in both directions (full duplex mode, no collisions)
 - MAC based congestion avoidance (pause frame)

88

L23 - VLAN and High Speed Ethernet

Implementation Overview

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

89

1000BaseX

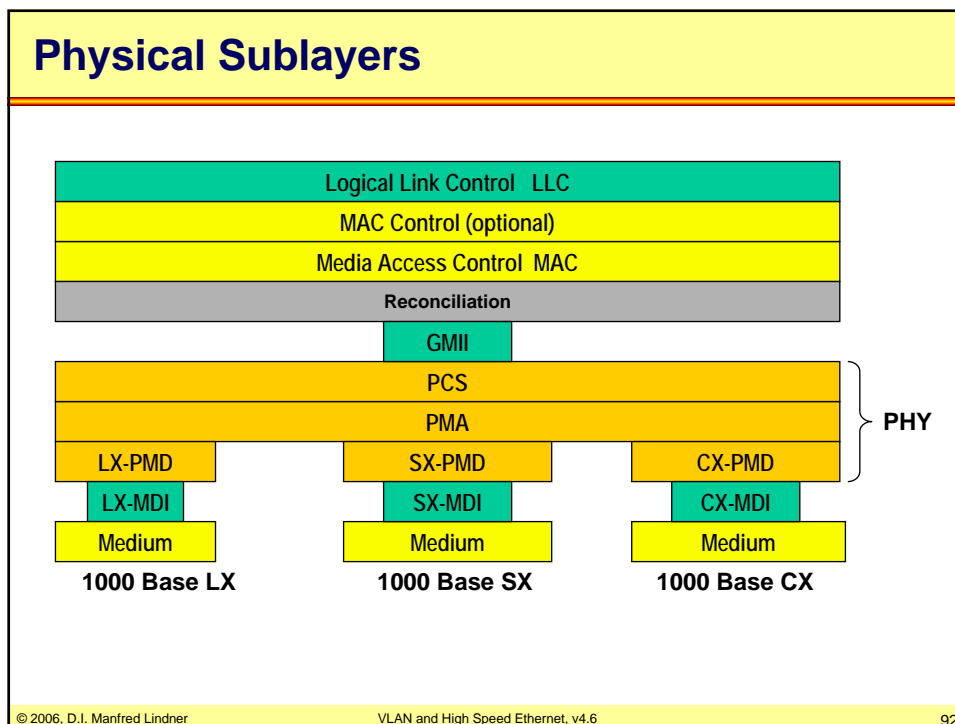

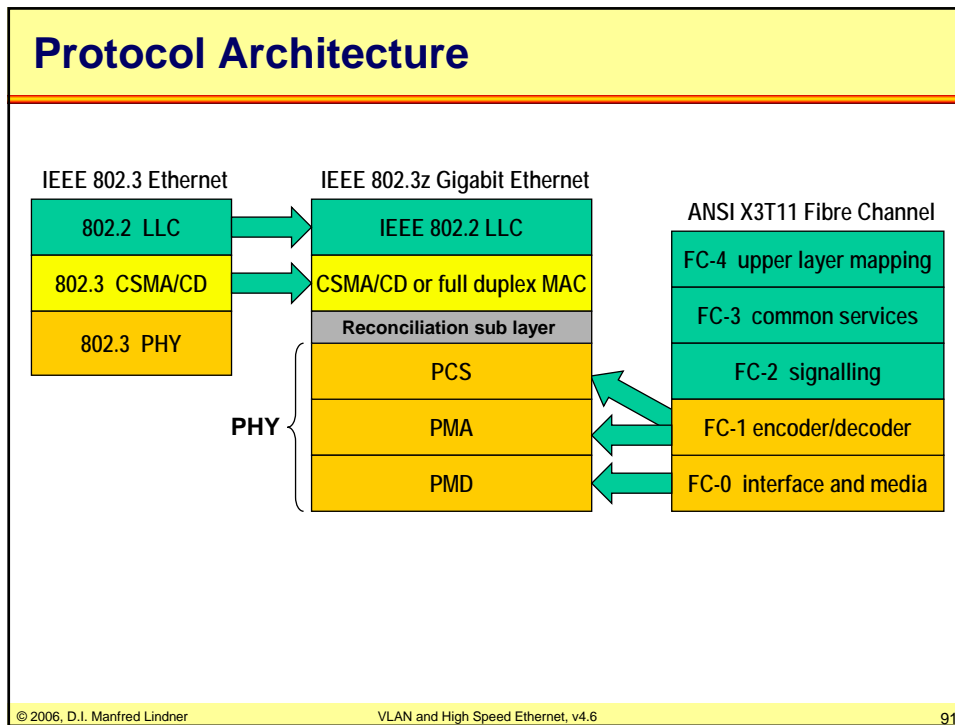

- Looks like 802.3 Ethernet from the data link layer upward
- Physical layer consists of well-tried high-speed components of the Fibre Channel implementation
- Coding is similar to Fibre Channel 8B/10B (FC1 layer) but at higher signal rate of 1.25 Gbaud
- Reconciliation layer translates between the link layer and the physical layer

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

90

L23 - VLAN and High Speed Ethernet

L23 - VLAN and High Speed Ethernet

CSMA/CD Restrictions (Half Duplex Mode)

- **The conventional collision detection mechanism CSMA/CD**
 - Requires that stations have to listen (CS) twice the signal propagation time to detect collisions
 - Collision window of 512 bit times at a rate of 1Gbit/s limits the maximal net expansion to 20m !

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

93

CSMA/CD Restrictions (Half Duplex Mode)

- **Solutions to increase the maximal net expansion:**
 - Carrier Extension:
 - extension bytes appended to (and removed from) the Ethernet frame by the physical layer
 - frame exists a longer period of time on the medium
 - Frame Bursting:
 - to minimize the extension bytes overhead, station may chain several frames together and transmit them at once ("burst").

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

94

L23 - VLAN and High Speed Ethernet

Frame Bursting

1

- **With both methods the minimal frame length is increased from 512 to 4096 bits**
 - = 512 bytes
 - The corresponding time is called slottime
- **If a station decides to chain several frames to a burst frame, the first frame inside the burst frame must have a length of at least 512 bytes**
 - By using extension bytes if necessary
- **The next frames (inside the burst frame) can have normal length (i.e. at least 64 bytes)**

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

95

Frame Bursting

2

- **Station may chain frames up to 8192 bytes (=burst limit)**
 - Also may finish the transmission of the last frame even beyond the burst limit
- **So the whole burst frame length must not exceed 8192+1518 bytes**
 - Incl. interframe gap of 0.096 μ s = 12 bytes

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

96

L23 - VLAN and High Speed Ethernet

1000BaseX Coding

- **8B/10B block encoding: each 8-bit group encoded by a 10 bit “code-group” (symbol)**
 - Half of the code-group space is used for data transfer
 - Some code groups are used for signaling purposes
 - Remaining code groups are violation symbols
 - -> easy error detection
 - Groups determine the maximal number of transmitted zeros or ones in a 10 bit symbol
 - -> easy clock signal detection (bit synchronization)
 - No baselinewander (DC balanced)
 - lacking DC balance would result in data-dependent heating of lasers which increases the error rate
 - Code efficiency: $8/10 = 1000/1250 = 80\%$

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

97

8B/10B Coding

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

98

L23 - VLAN and High Speed Ethernet

8B/10B Coding

- **Each GMII 8 bit group (data) can be represented by an associated pair of 10 bit code groups**
 - Each pair has exactly 10 ones and 10 zeros in sum
- **Sender toggles Running Disparity flag (RD) to remember which code group to be sent for the next data-octet**
- **Hence, only non-symmetric code groups need a compensating code group**
 - symmetric code groups already have equal number of ones and zeros

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

99

8B/10B Coding

- **Code groups which are not registered in the code-table are considered as code-violation**
 - these code groups are selected to enable detection of line errors with high probability
- **256 data and 12 control code-group-pairs are defined**
- **Control-code-groups are used independently or in combination with data-code-groups**

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

100

L23 - VLAN and High Speed Ethernet

Ordered Sets

- **Control-code-groups are classified by "ordered sets" after their usage:**
 - Configuration C for autonegotiation
 - Idle I used between packets
 - Encapsulation:
 - R for separating burst frames
 - S as start of packet delimiter
 - T as end of packet delimiter
 - V for error propagation

Implementations

- **Actually 2 different wavelengths on fibre media, both full duplex, SC connector**
 - 1000Base-SX: short wave, 850 nm multimode (up to 550 m length)
 - 1000Base-LX: long wave, 1300 nm multimode or monomode (up to 5 km length)
- **1000Base-CX:**
 - Twinax Cable (high quality 150 Ohm balanced shielded copper cable)
 - About 25 m distance limit, DB-9 or the newer HSSDC connector

L23 - VLAN and High Speed Ethernet

1000BaseT

- **1000Base-T defined by 802.3ab task force**
 - UTP uses all 4 line pairs simultaneously for duplex transmission!
 - Using echo-cancelling: receiver subtracts own signal
 - 5 level PAM coding
 - 4 levels encode 2 bits + extra level used for Forward Error Correction (FEC)
 - Signal rate: $4 \times 125 \text{ Mbaud} = 4 \times 250 \text{ Mbit/s}$ data rate
 - Cat. 5 links, max 100 m; all 4pairs, cable must conform to the requirements of ANSI/TIA/EIA-568-A
 - Only 1 CSMA/CD repeater allowed in a collision domain
 - note: collision domains should be avoided

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

103

Autonegotiation

- **Both 1000Base-X and 1000Base-T provide autonegotiation functions to determinate the**
 - Access mode (full duplex - half duplex)
 - Flow control mode
- **Additionally 1000Base-T can resolve the data rate**
 - Backward-compatibility with 10 Mbit/s and 100 Mbit/s
 - Also using FLP-burst sessions

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

104

L23 - VLAN and High Speed Ethernet

1000BaseX Autonegotiation

- **1000Base-X autonegotiation uses normal (1000Base-X) signalling !**
 - "Ordered sets" of the 8B/10B code groups
 - No fast link pulses !
 - Autonegotiation had never been specified for traditional fiber-based Ethernet
 - So there is no need for backwards-compatibility
- **1000Base-X does not negotiate the data rate !**
 - Only gigabit speeds possible
- **1000Base-X autonegotiation resolves**
 - Half-duplex versus full-duplex operation
 - Flow control

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

105

1000BaseX Autonegotiation

- **Autonegotiation is part of the Physical Coding sublayer (PCS)**
- **Content of base-page register is transmitted via ordered set /C/**
- **On receiving the same packet three times in a row the stations replies with the Ack -bit set**
- **Next-pages can be announced via the next-page bit NP**

108

L23 - VLAN and High Speed Ethernet

Next-Pages 2

- **Acknowledge 2 (Ack2)**
 - Ack2 is set to 1 if station can perform the declared capabilities
- **Message Page (MP)**
 - Differentiates between message-pages (MP=1) and
 - Unformatted-pages (MP=0)
- **Toggle (T)**
 - Provides synchronization during exchange of next-pages information
 - T-bit is always set to the inverted value of the 11th bit of the last received link-codeword

VLAN and High Speed Ethernet, v4.6

109

1000BaseT Autonegotiation

- **Autonegotiation is only triggered when the station is powered on**
- **At first the stations expects Gigabit-Ethernet negotiation packets (replies)**
- **If none of them can be received, the 100Base-T fast link pulse technique is tried**
- **At last the station tries to detect 10Base-T stations using normal link pulses**

111

10 Gigabit Ethernet (IEEE 802.3ae)

- **Preserves Ethernet framing**
- **Maintains the minimum and maximum frame size of the 802.3 standard**
- **Supports only full-duplex operation**
 - CSMA/CD protocol was dropped
- **Focus on defining the physical layer**
 - Four new optical interfaces (PMD)
 - To operate at various distances on both single-mode and multi-mode fibers
 - Two families of physical layer specifications (PHY) for LAN and WAN support
 - Properties of the PHY defined in corresponding PCS
 - Encoding and decoding functions

© 2006, D.I. Manfred Lindner

VLAN and High Speed Ethernet, v4.6

112

L23 - VLAN and High Speed Ethernet

PMDs

- **10GBASE-L**
 - SM-fiber, 1300nm band, maximum distance 10km
- **10GBASE-E**
 - SM-fiber, 1550nm band, maximum distance 40km
- **10GBASE-S**
 - MM-fiber, 850nm band, maximum distance 26 – 82m
 - With laser-optimized MM up to 300m
- **10GBASE-LX4**
 - For SM- and MM-fiber, 1300nm
 - Array of four lasers each transmitting 3,125 Gbit/s and four receivers arranged in WDM (Wavelength-Division Multiplexing) fashion
 - Maximum distance 300m for legacy FDDI-grade MM-fiber
 - Maximum distance 10km for SM-fiber

VLAN and High Speed Ethernet, v4.6

113

WAN PHY / LAN PHY and their PCS

- **LAN-PHY**
 - 10GBASE-X
 - 10GBASE-R
 - 64B/66B coding running at 10,3125 Gbit/s
- **WAN-PHY**
 - 10GBASE-W
 - 64B/66B encoded payload into SONET concatenated STS192c frame running at 9,953 Gbit/s
 - Adaptation of 10Gbit/s to run over traditional SDH links

10 Gigabit Ethernet over Copper

- **IEEE 802.3ak defined in 2004**
 - 10GBASE-CX4
 - Four pairs of twin-axial copper wiring with IBX4 connector
 - Maximum distance of 15m
- **IEEE 802.3an working group**
 - 10GBASE-T
 - CAT6 UTP cabling with maximum distance of 55m to 100m
 - CAT7 cabling with maximum distance of 100m
 - Standard ratification expected in July 2006
